FICTIONAL TEST DOCUMENT - NOT OPERATING INSTRUCTIONS

For this fictional training example, a sudden draft drop can coincide with a fan interruption or a blocked duct. An operator should verify the sensor reading and check the fan and duct.

Fictional cyclone-principle example: A cyclone separator guides a dusty gas into a circular path. The resulting spin drives heavier particles toward the outer wall, where they move downward for collection, while the cleaner gas leaves through the outlet. This educational description is independently authored for the public demo and is not operating guidance.
